A photograph of several wind turbines against a clear sky. The blades are white with red and white striped tips. A large number of small, dark silhouettes of bats are scattered across the sky, appearing to fly around the turbines. The text is overlaid on the image in white.

Whistling Like a Bat:

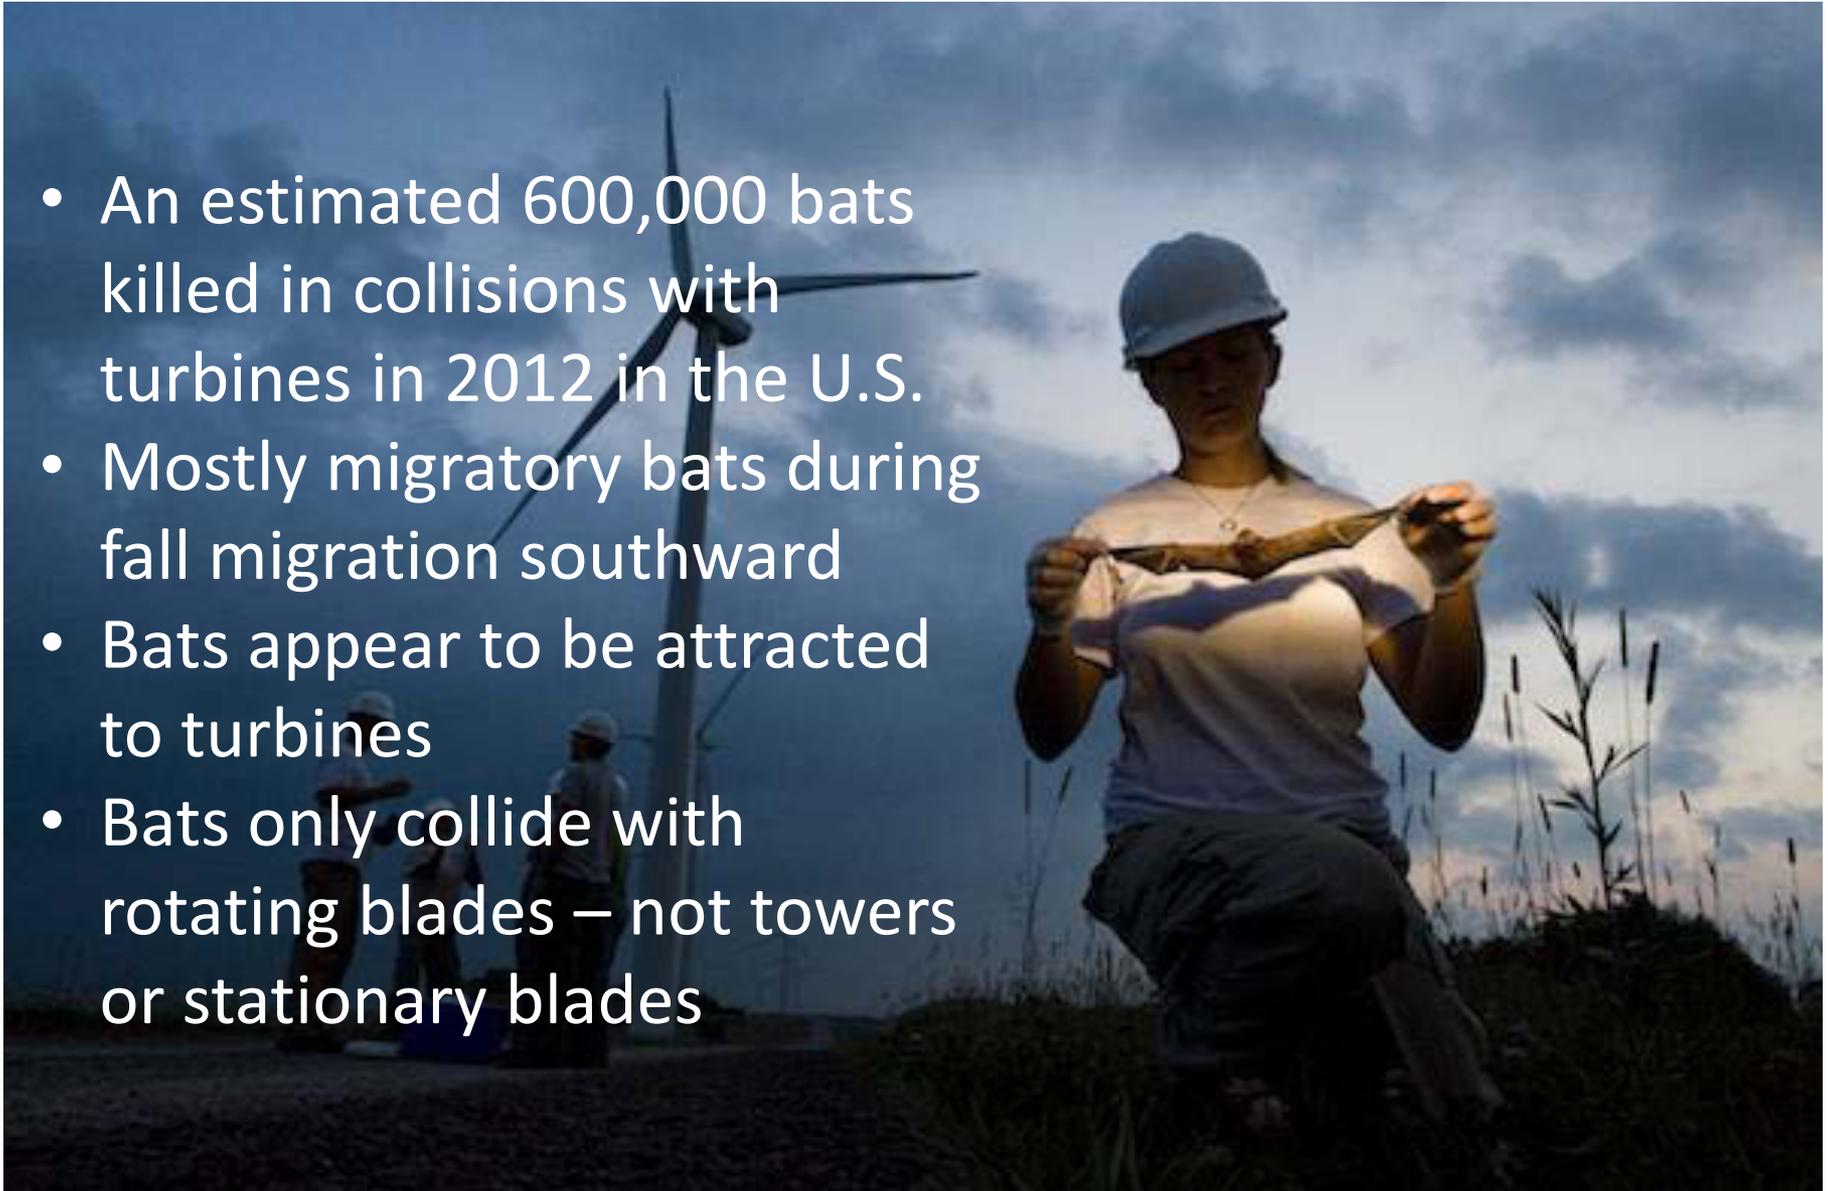

Development of an Ultrasonic Whistle to Deter Bats From Wind Turbines

Paul R. Sievert

Department of Environmental Conservation
University of Massachusetts Amherst

BAT MORTALITY AT WIND FACILITIES

- An estimated 600,000 bats killed in collisions with turbines in 2012 in the U.S.
- Mostly migratory bats during fall migration southward
- Bats appear to be attracted to turbines
- Bats only collide with rotating blades – not towers or stationary blades

Migratory Bats

Hoary Bat

Silver-haired Bat

Eastern Red Bat

ULTRASOUND AS DETERRENT

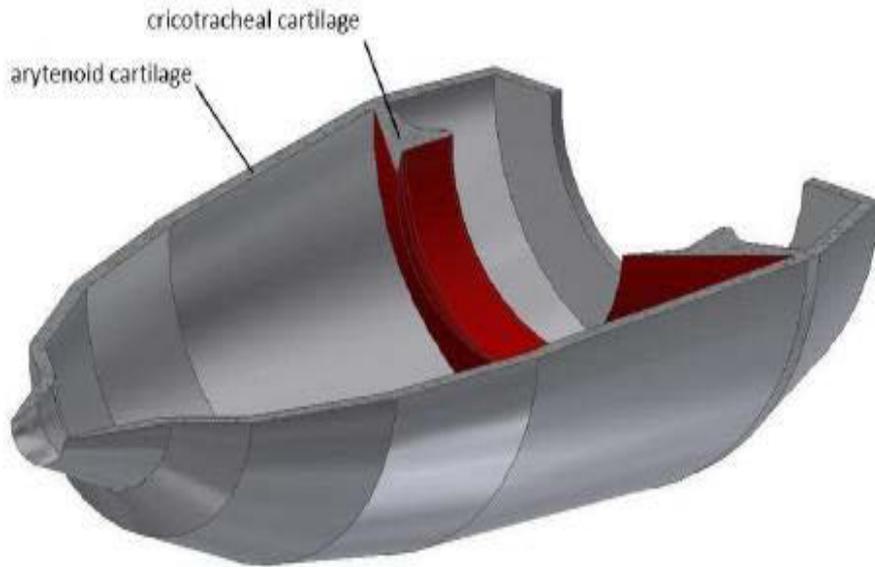

- Attenuates quickly in the atmosphere
- Birds and large mammals (including people!) can't hear it
- Bats avoid "noisy" environments when foraging
- Bats can learn to avoid toxic moths which emit ultrasonic warning clicks

CURRENT DETERRENT TECHNOLOGY

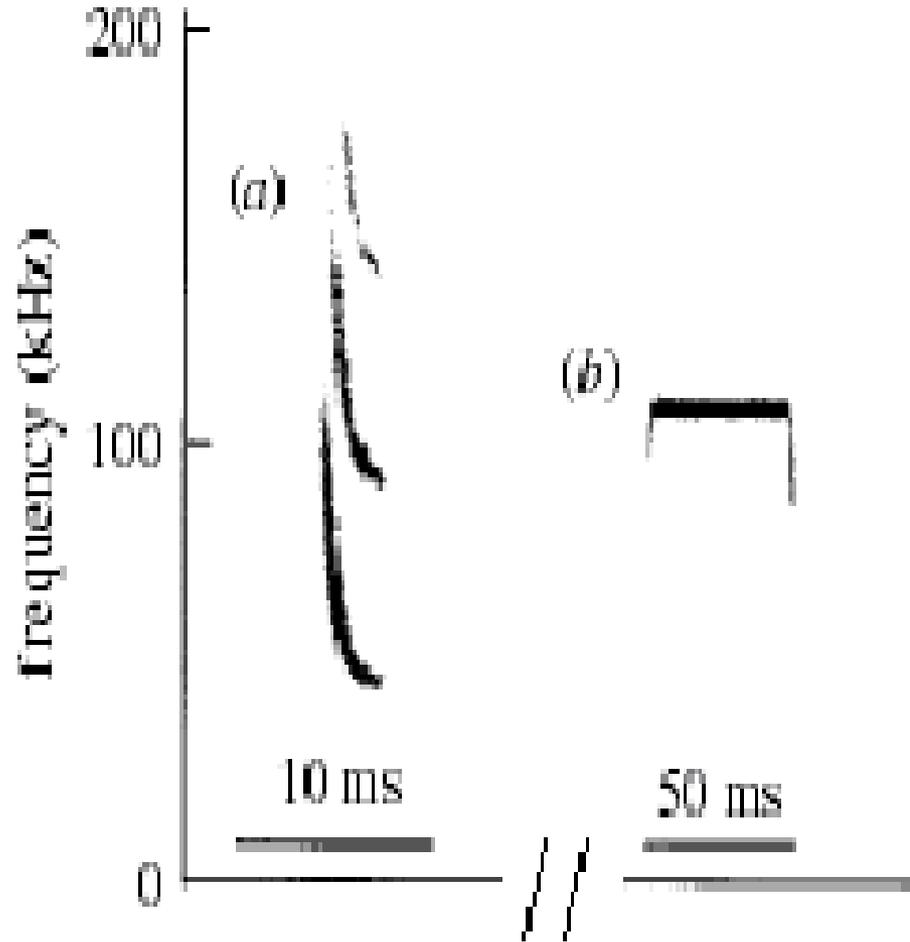

- Single tones do not appear to work (bats can alter call to avoid)
- Electrically-powered broadband ultrasonic noise generator
- 10-100 kHz range
- Success in lab trials and trials at foraging sites
- Not successful in reducing bat mortality when mounted on turbine nacelles

OUR PROPOSED SOLUTION

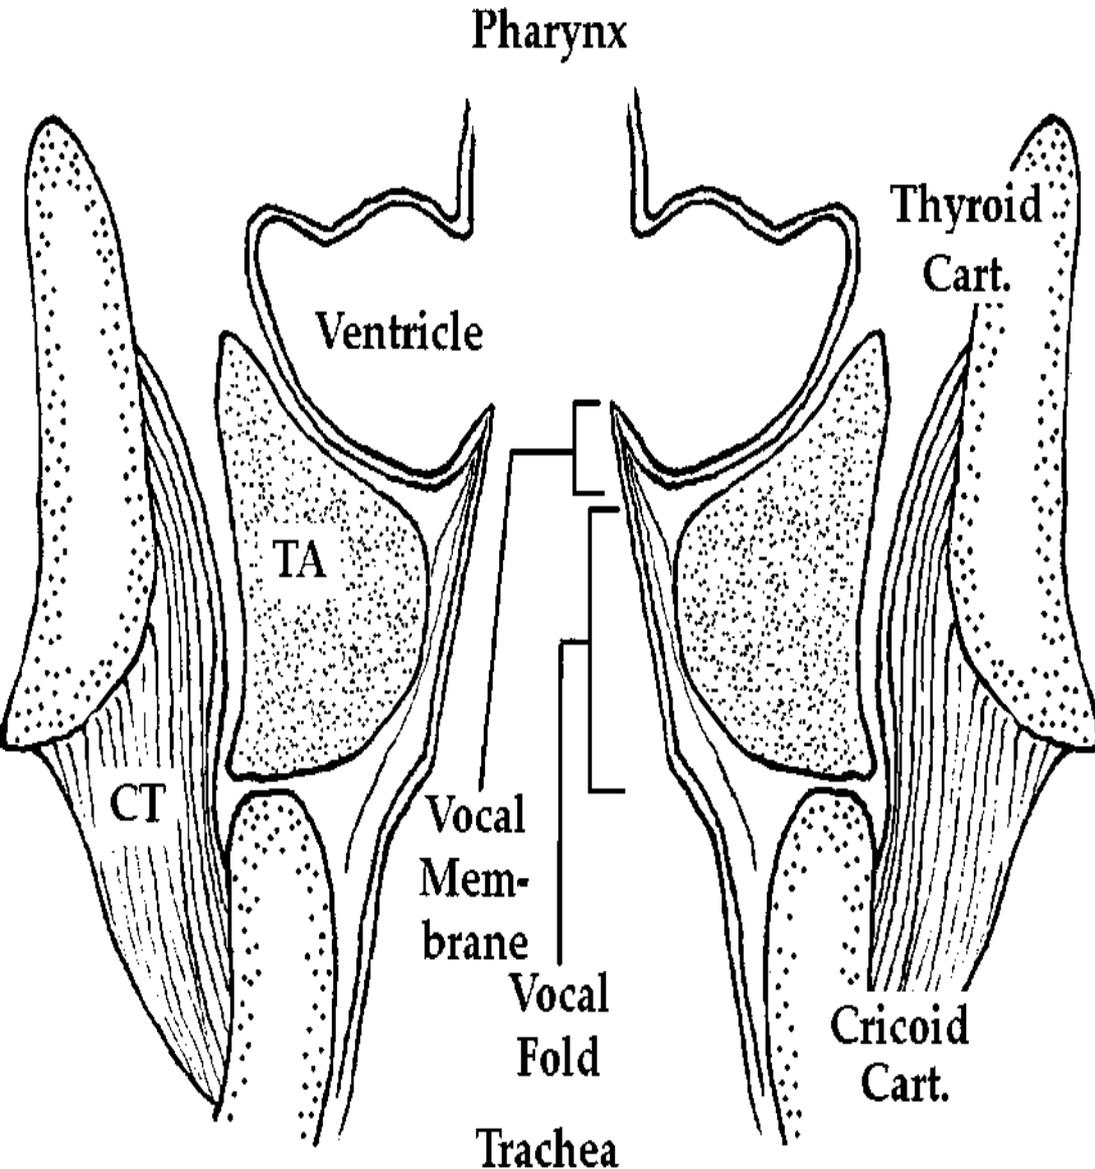

- Wind-blown whistles
- 25-55 kHz range
- Over wind speeds up to 6 m/s
- Blade speeds up to ~ 42 m/s
- Lower bound hard to predict
- Based on bat larynx, frequency-modulated

BAT ECHOLOCATION CALLS

- Frequency-modulated
- Constant frequency

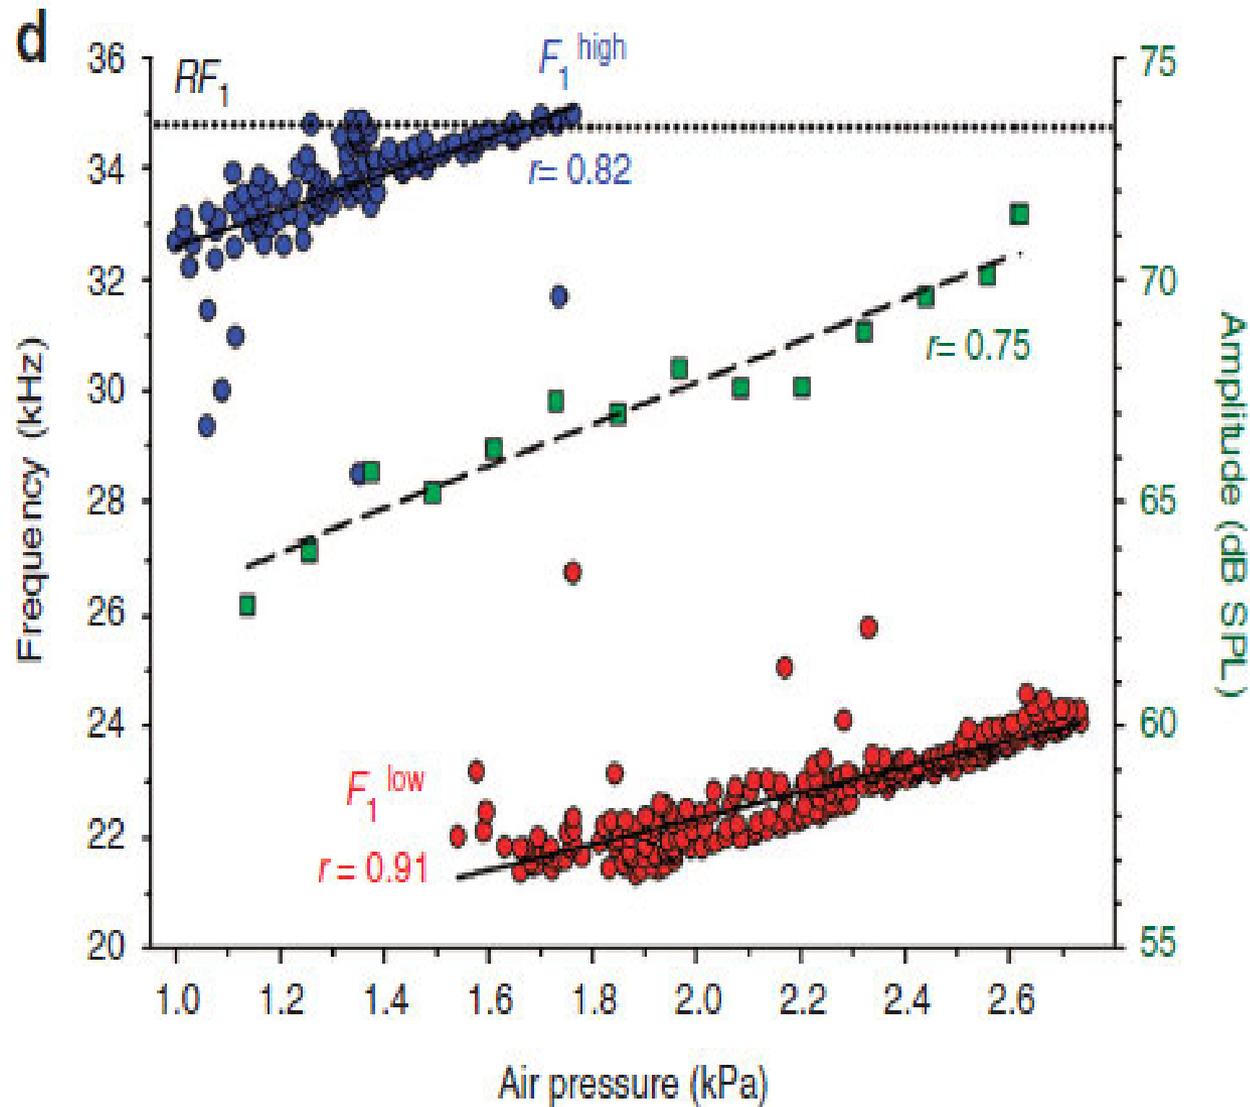

BAT LARYNX ANATOMY

Schematic coronal section through middle of larynx showing anatomy of the vocal membrane. The membrane projects upward (rostrally) from main body of vocal fold.

CT: Cricothyroid muscle.
TA: Thyroarytenoid (vocalis) muscle

EXCISED LARYNX VOCALIZATIONS

Task 1: Characterize bat avoidance responses to ultrasound regimes

Task 2: Design initial biomimetic prototype

Task 3: Develop series of prototype whistles operating over range of frequencies

Task 4: Test prototype whistle series on bats in laboratory

Task 5: Test prototype whistles on wind turbine

Month	Task 1	Task 2	Task 3	Task 4	Task 5

M24	Task 5					

Mexican Free-Tailed Bat

Task 1: Characterize bat avoidance responses to ultrasound regimes

- Capture wild bats
- Perform Y-maze selection trials
- Perform perch selection trials
- Evaluate free-flying bat trajectories

Tri-colored Bat

Little Brown Bat

Big Brown Bat

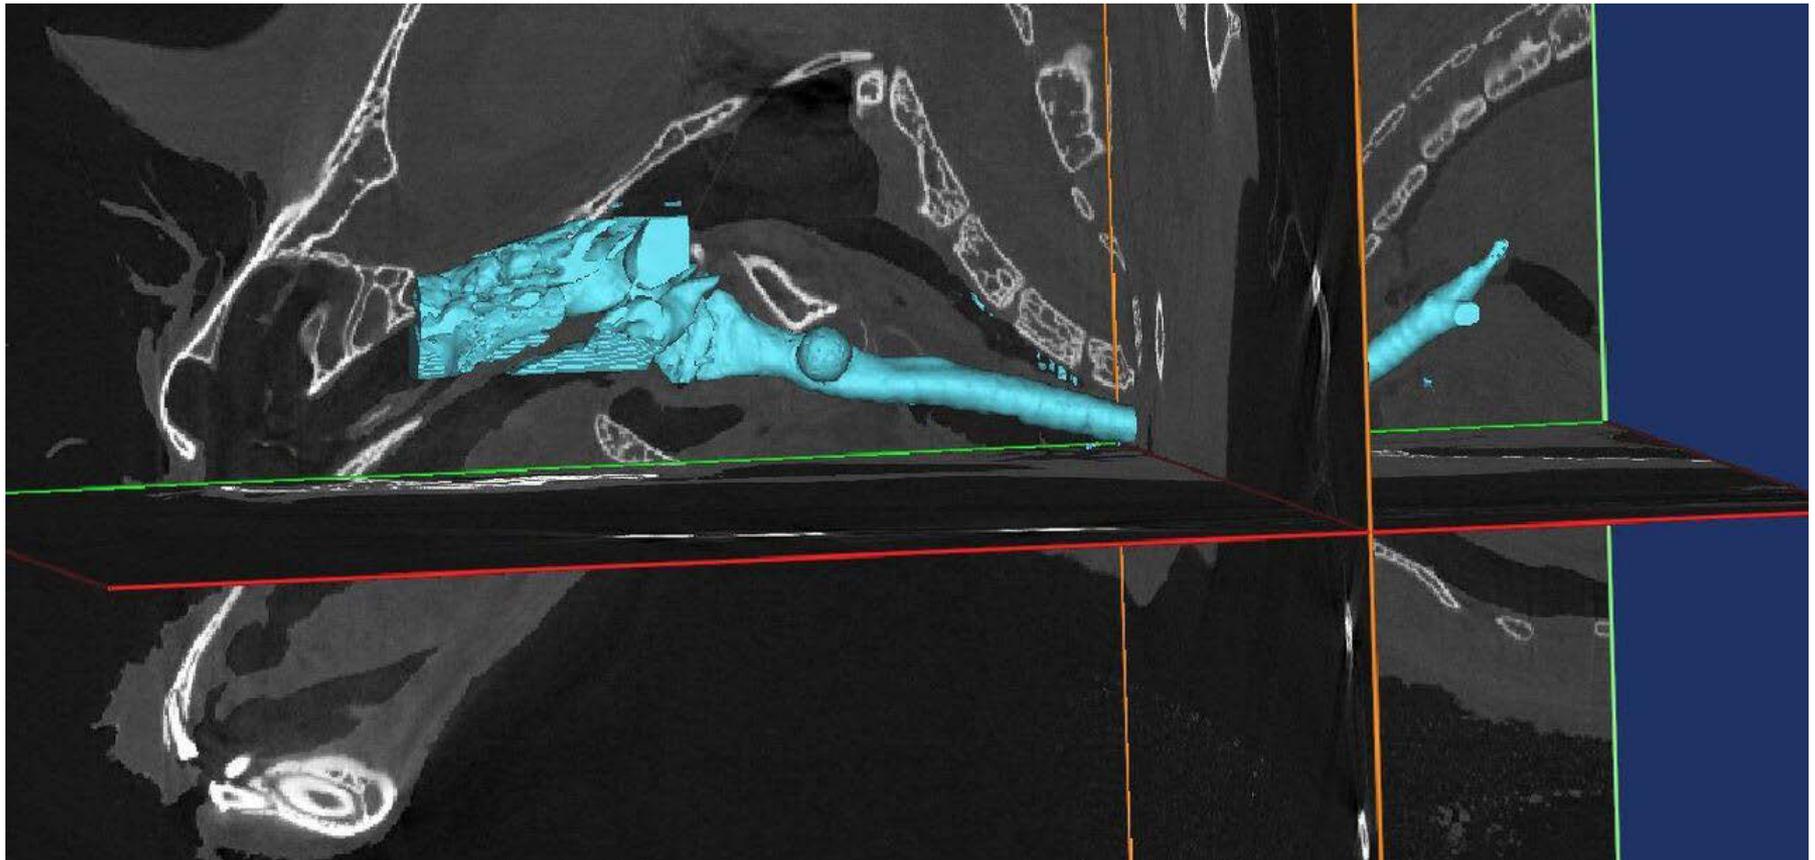

Task 2: Design initial biomimetic prototype

- Obtain candidate biological models
- Analyze candidate biological models
- Determine initial biological model through physical prototyping
- Increase sound power level of prototype
- Generate sound across range of wind speeds from prototype
- Generate frequency-modulated output from prototype

Task 3: Develop series of prototype whistles operating over range of frequencies

- Design a frequency-modulated whistle operating at $\sim 25\text{-}35$ kHz
- Design a frequency-modulated whistle operating at $\sim 35\text{-}45$ kHz
- Design a frequency-modulated whistle operating at $\sim 45\text{-}55$ kHz
- Recording of ultrasonic regimes produced by whistles operating in concert

Task 4: Test prototype whistle series on bats in laboratory

Tri-colored Bat

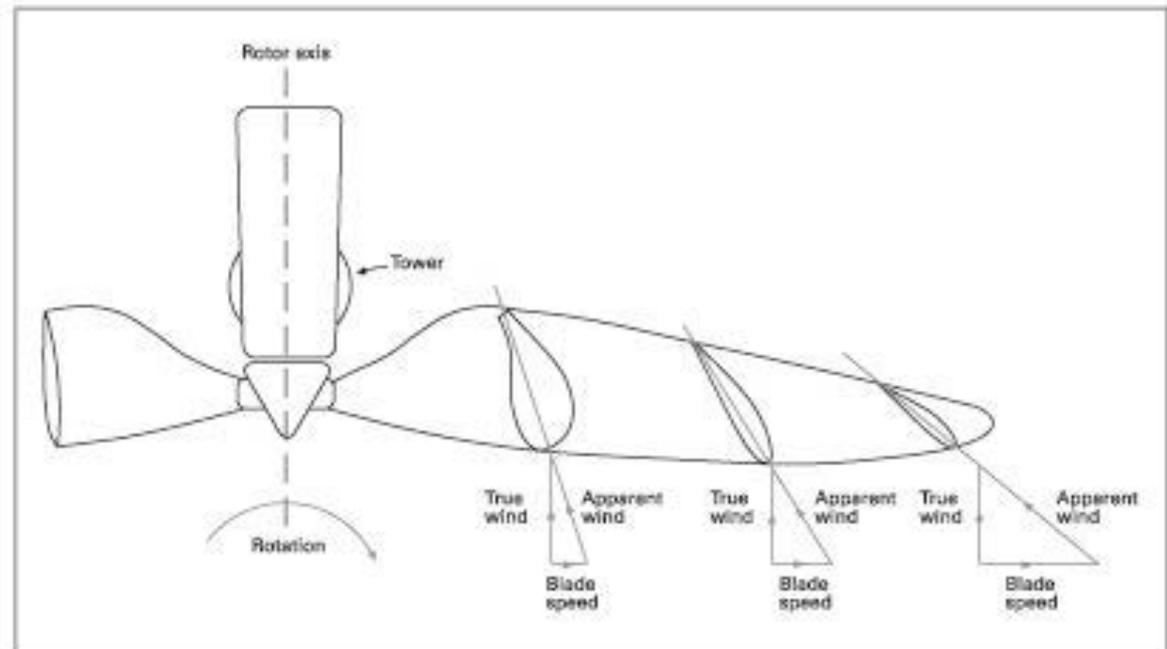

Little Brown Bat

Big Brown Bat

Task 5: Test prototype whistles on wind turbine

Blade twist

Future Directions: Test Effectiveness of Bat Whistles in the Field

Thank you!
