

Tracking porpoise underwater movements in Tidal Rapids

Jamie Macaulay, Jonathan Gordon, Simon
Northridge, Doug Gillespie

The Problem

- Very little knowledge on the importance of tidal habitats for harbour porpoises.
- Need to assess collision risk with turbines. Underwater movement and dive depth.

Possible Solutions

Visual

- Relatively cheap equipment costs.
- Impossible to tell what animals are doing underwater
- Difficult detection in high sea states

Tags

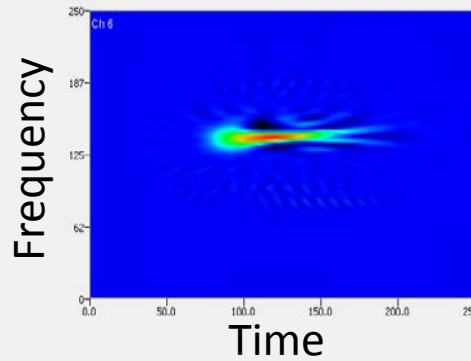

- Quality of data is excellent
- Difficult/impossible to catch animals.
- Time spent in tidal area per animal minimal.

PAM

- Can detect all animals within a certain range
- Some methods well developed
- Practical methods for tidal areas not developed.
- Porpoise acoustics, HF and highly directional

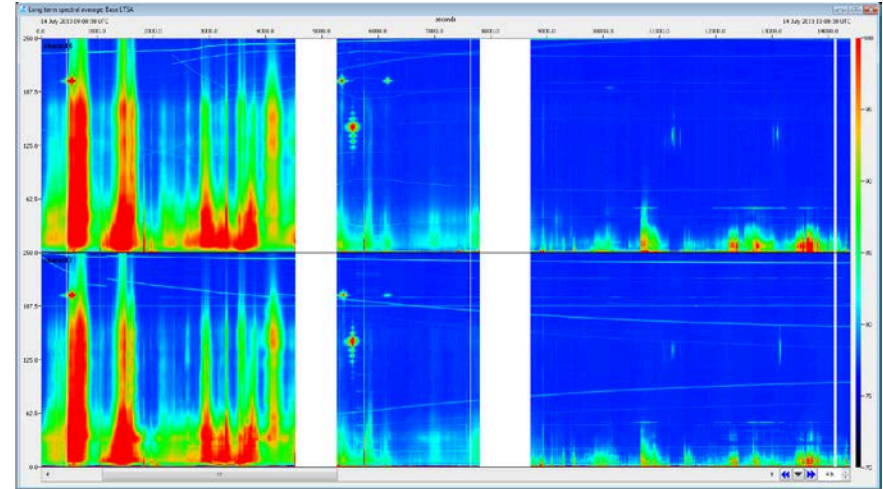

The Harbour Porpoise

PAM in Tidal Areas

- Noise
- Narrow echo location beam and widely spaced hydrophones.
- Multiple animals present/echoes.
- If array on boat must be quickly recoverable.
- Technology for HF recordings.

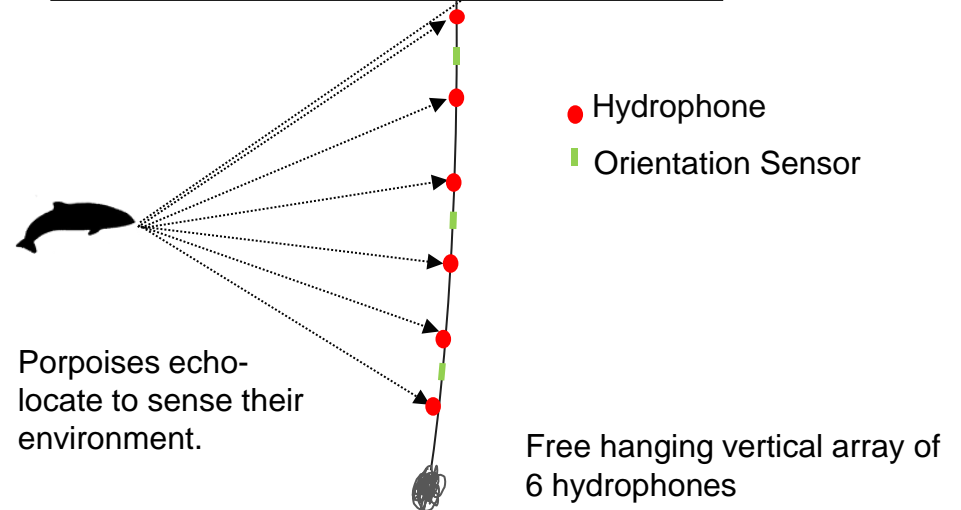

Hydrophone Array

- Drifting hydrophone array reduces flow noise.
- Array is quickly recoverable via winch.
- Open Tags model hydrophone positions.
- Quiet platform and long vertical baseline.
- NI tech for recordings.

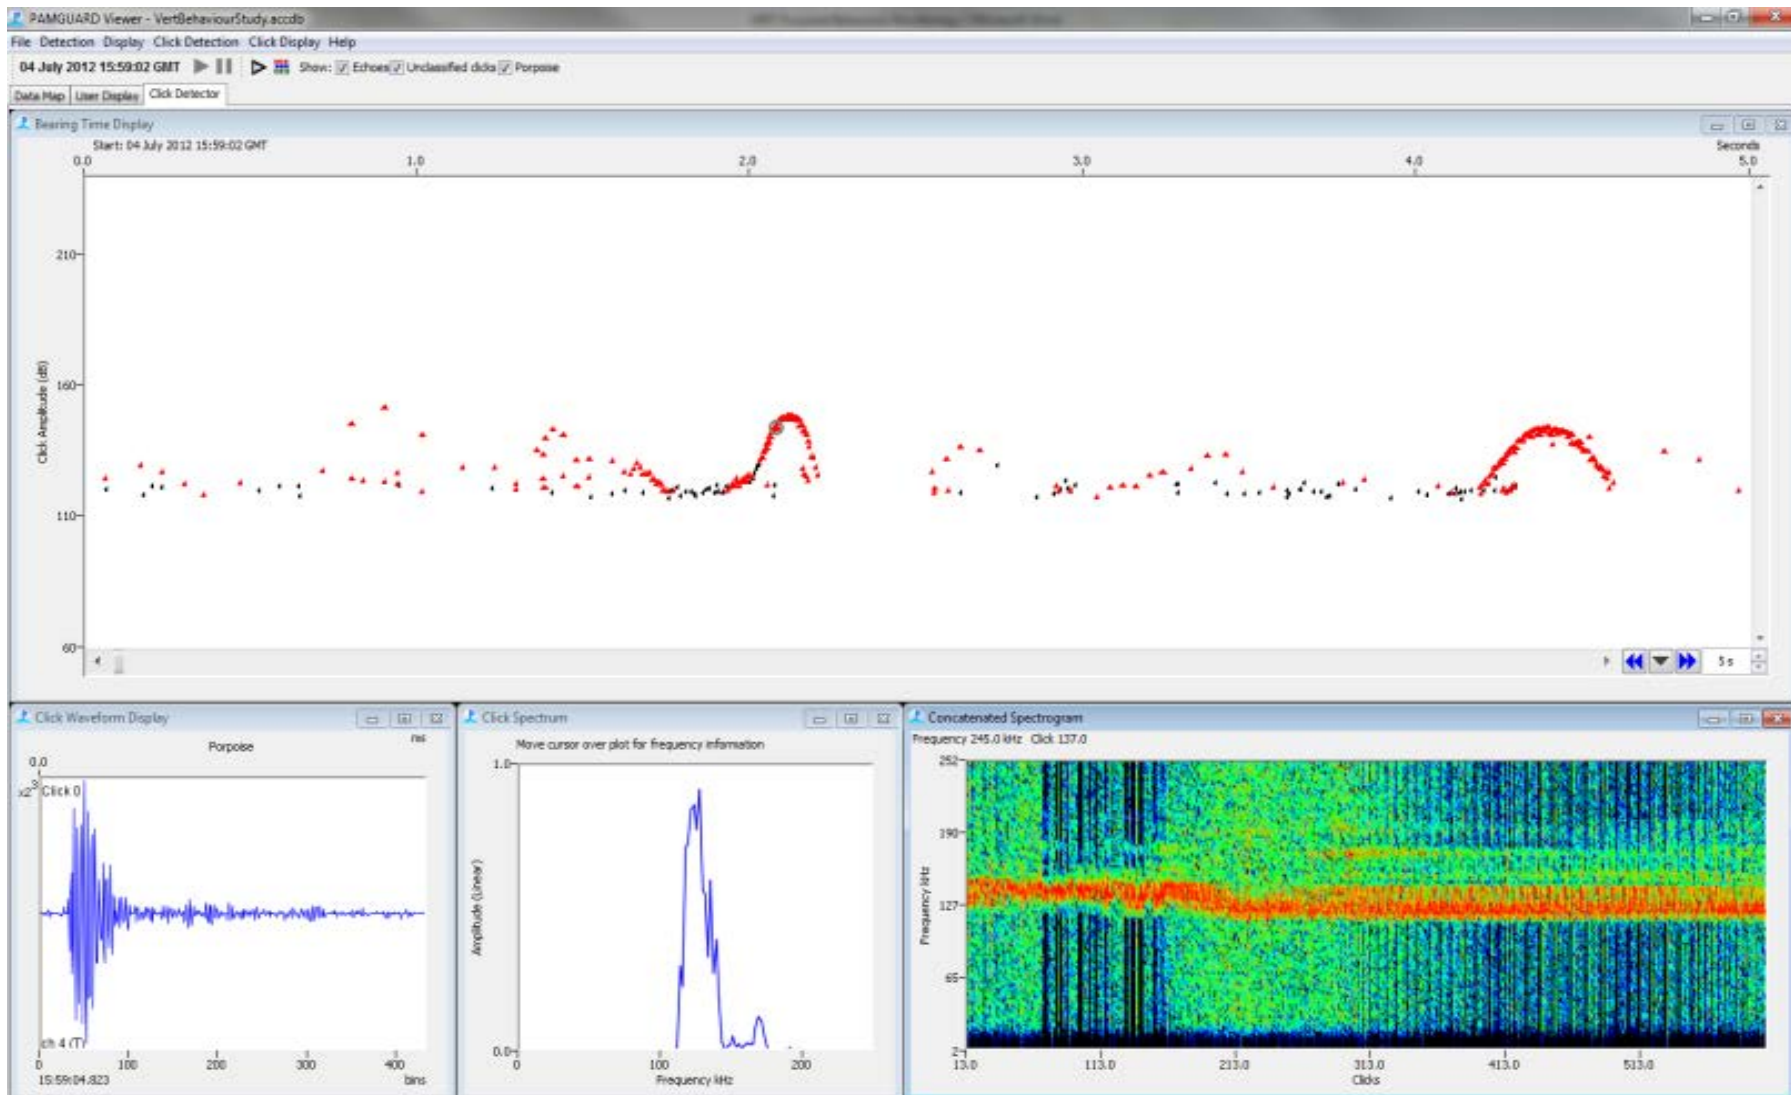

Rigid cluster of 4 hydrophones

Porpoise Dive Depths

Predicting Collision Risk

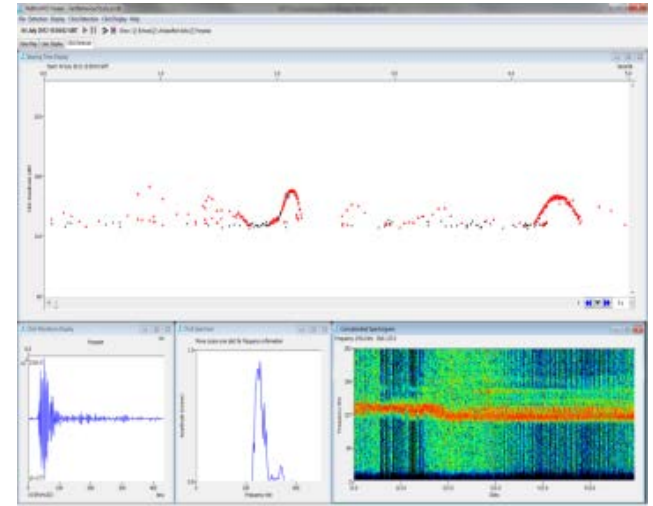

- Depth distribution is a start when assessing collision risk
- Different patterns in different places. Early days but we are building up a picture.
- 3D tracking means that we can begin to look at 'flux' of animals; movement of animals through an area.

Behaviour in Tidal Habitats

- Can cross reference behaviour with positions.
- Current work includes cross reference dive tracks with inter click interval.
- Possible to build up a 3D beam profile to look at echolocation behaviour ?

Moving to an Autonomous System

NERC KE

- Cheaper to build, cheaper to deploy.
- Should be deployable from a rib.
- Can cope with worse conditions.
- Will record raw .wav files, GPS location and orientation data.
- Will integrate with PAMGUARD
- First testing this summer.
- **Open Hardware*** and software .

Summary

- PAM can be used to accurately track porpoise and other vocalising cetaceans underwater.
- Interesting data on behaviour in tidal habitats has been collected and system has been validated over a number of years.
- Provides some of the data required to predict collision risk.
- An open, more practical and cost effective autonomous system is being developed.
